

# NYU Physics I — 2016-10-11

Agenda — Reading — statics torque  
impulse collision.

— Comments on Hw, exams.

— Qs

— Bouncing Ball.

$$F = (3.6 \times) N$$

↑  
length

$$F = mg N$$

$$F = mg \checkmark$$

Box your actual answer.

Friction: sliding:  $f = \mu N$   
static:  $f < \mu N$ .

"efficiency"

← Coefficient of Performance  
C.O.P.

pool ball.

not to scale

1.5 m

hard floor

in contact  
for (1 ms???)

N? AVERAGE  
Free-body diagram  
for duration of  
contact.

while falling: Impulse:  $\vec{F}_g \cdot \Delta t_{\text{fall}} = \vec{p}_{\text{contact}}$   
 $\sim mg(0.4s)$

while in contact:  $\sim \vec{N}(0.001s) = \cancel{\vec{p}_{\text{contact}}}$   
 $= -1.8 \vec{p}_{\text{contact}}$

$$|\vec{N}| = 1.8 mg \frac{(0.4s)}{0.001s} \approx 10^3 mg$$

cue ball

Average F.B.D.

for 5-ball during  
(1-ms) collision.
