

NYU Physics I

2017-10-12

- Agenda:
- Exams. — Box units, direction, ...?
 - Questions.
 - Block on table.
 - Reading — Forces, momenta
impulse collision
Torque
(cross product)

Block on a light table

$$m \ll M$$

$m \ll M$
(ignore m terms)

positive = \curvearrowright ve

static.

$\odot y: N_A + N_B + (-Mg) = 0$

(torque): $(-x Mg) + l N_B = 0$

statics

$$\vec{\tau} \equiv \vec{r} \times \vec{F}$$

↑
pseudo-
vector

↑
cross product

direction: out of page

magnitude:

$$|\vec{\tau}| = |\vec{r}| |\vec{F}| \sin \phi$$

$$l N_B = x M g$$

$$N_B = \underbrace{\frac{x}{l}} M g$$

$$N_A = M g - N_B$$

$$N_A = \underbrace{\frac{l-x}{l}} M g$$
